

EDID

Inventory of serial-numbers of plug and play monitors

The features at a glance

- | Fast and uncomplicated overview of all deployed and active monitors
- | Integration into existing inventory systems (IT assetmanagement tools)
- | No extra data storage
- | Uncomplicated analysis by using standard tools like Web-Reports

Provides the inventory of serial-numbers of all plug and play monitors and the delivery of the information to Microsoft® Systems Management Server 2003, System Center Configuration Manager 2007, Enteo NetInventory or IBM Tivoli

EDID was developed based on Best Practice and is appointed successfully in the financial-services sector for years now.

With EDID, monitor serial-numbers of all plug and play monitors are retrieved and delivered to the appropriate hardwareinventory application. The preparation of the collected data is consequently done by the standard application used for the asset data-preparation in your company, e.g. by Web-Reports of the Microsoft® Systems Management Server 2003 and System Center Configuration Manager 2007.

The Approach

EDID retrieves the monitor serial-numbers encrypted within the system and considers the different industry-standards used for the encryption at the same time.

After EDID retrieved the serial-number, it can be optionally processed and displayed:

- | Delivery to SMS through the hardware-inventory
- | Export to a text-file on the client
- | Export to the windows-registry of the client
- | Export to a windows-dialog

Since the data can be exported to the windows-registry as well as into a text-file, a connection to various IT assetmanagement tools is possible.

Ideally, the IT asset-management is connected to Microsoft® SCCM, so that not only the monitor serial-numbers but also the rest of the hardware data of the clients are available through the Microsoft® SCCM hardware inventory.

Software Requirements

- | Microsoft® Windows 2000 Client, Microsoft® Windows XP Professional oder Microsoft® Windows Vista
- | Required hard disc space:
Approx. 1 MB per client
